

● SHKOR LABS · R&D FOR AUTONOMOUS BUSINESS

Autopilot for any **business.**

We mirror a company into a living twin, rehearse decisions on it, and hand the routine to an AI agent that runs on a heartbeat — every second, minute, hour and day.

Pre-seed \$1M

SAFE · uncapped · MFN

Shkor Labs LLC · Wyoming

Every business runs on routine nobody has time for.

— HANDS

Owners are the bottleneck

Inbox, follow-ups, reports, scheduling, small fixes. A 5–50 person company can't hire for all of it, so most of it just doesn't happen.

— COPILOTS

AI tools still need a driver

Chat windows and copilots wait for a human to prompt every step. They assist. They don't run anything.

— TRUST

Agents aren't trusted with keys

Autonomous agents loop, hallucinate and act outside their remit. No audit trail, no limits, no memory of why — so nobody hands them real work.

A company is a stream of events. So it can be replayed — and run.

01 • MIRROR

Capture the twin

Messages, tasks, calls, payments and decisions become signed events in one append-only log. Replay it and you get the company as a living model.

02 • REHEARSE

Decide on the twin first

Changes are tried against the twin and its real history. Where the agent isn't sure, it escalates to a person with the full story.

03 • AUTOPILOT

Hand over the routine

An agent that lives by ticks takes the routine, with real tools. Every action feeds back into the twin, so it gets sharper over time.

Not a chatbot. A heartbeat.

1 s

Reflexes

telemetry, alerts, bot commands — no LLM, zero cost

1
min

Triage

inbox, routing, quick fixes

1 h

Execution

tasks end-to-end with real tools + hourly digest

1
day

Planning

larger work, daily manifest, nightly self-training

Busy levels skip a beat instead of piling up. Only digests travel upward.

The moat is governance, not the model.

SIGNED

Every step on the record

ed25519-signed, hash-chained event log. 3.1M events verified end-to-end.

```
$ simbiot verify  
✓ chain intact
```

BOUNDED

Trust circles

Rights come from verified identity, never from message text. A guard checks every tool call before it runs.

FRUGAL

LLM only where it matters

Rules and fast decision models filter before an LLM wakes. Reflexes and quiet beats cost nothing.

LEARNING

Improves on outcomes

Small student models train nightly on real outcomes — and only replace the rules after beating a baseline on fresh data.

Who · how often · how deep.

4 × 4 × 4.

4 TRUST CIRCLES

- 1 Owner — full tools
- 2 Board — work, no secrets
- 3 Members & agents — scoped
- 4 Everyone else — reply only

4 RHYTHMS

- 1 s reflex
- 1 min triage
- 1 h execution
- 1 day planning

4 MEMORY DEPTHS

- D0 just this message
- D1 the conversation
- D2 relevant past episodes
- D3 the archive

Memory is private by circle: a board-level conversation can never surface the owner's private chats. The same code serves a two-person studio and a 500-person company — only the table changes.

We don't sell what we don't run.

Every lab is a real business — a founder plus AI agents on shared infrastructure inside Cooperative 42. Each one is a live test bench for the autopilot.

LIVE

billing: Stripe (US LLC) + card acquiring (Belarus)

Source: production event store and cooperative portal, 18 Oct 2026. Every number above is a query, not an estimate.

Mistakes become rules. Rules become instinct.

1 • OBSERVE

Outcomes, not opinions

Every decision is logged with what happened next — a reaction, a retry, a fix.

2 • LEARN

Nightly students

Small models train on that experience and stay in shadow until they beat a baseline.

3 • REFLECT

Rules for humans

Repeated failures turn into a proposed rule, sent to the owner for a yes.

4 • GATE

Ship with proof

Code changes close only with a commit and a passing test. No silent self-edits.

Example from this week: the agent improved its own Telegram behaviour, then tried to close the task without a test. The new gate now refuses that — the change shipped with a commit and a passing test.

One ladder, **three rungs.**

01 • COMMUNITY

Build on our stack

\$99/mo

Our lab MCP, Claude Code and the autopilot for anyone building a product. Self-serve, community-run. The studio keeps 10%+ of sales made through its payments.

02 • LAB

Built with us

\$999/mo min

Startups in a cohort, worked with personally. Each month: the larger of \$999 or a revenue share (10%+). Any shortfall is paid now or deferred as BTC-indexed debt.

03 • STUDIO

Paid to build

salary

The best founders join the studio payroll — as the core team is today — and keep building their own startups while running cohorts for the next ones.

every rung pays the studio • every rung has a reason to climb • the studio is run by people who climbed it

Investors don't just fund the studio. They steer it — every quarter.

1 • INVEST

Into the studio

One SAFE in Shkor Labs
— exposure to every
lab, the community and
the platform.

2 • VOTE

A seat in the cohort

Each quarter investors
vote on how the
studio's investment
pool is split across its
startups.

3 • ALLOCATE

On real data

Votes are informed by
each startup's live
record: revenue,
shipped tasks, agent
activity — signed, not
self-reported.

4 • RETURN

Revenue flows back

Fees and revenue
shares from every rung
return to the studio and
fund the next quarter.

The voting machinery already exists: Cooperative 42 runs investment votes and awards on its portal today. The pool can reach beyond the labs — to the strongest community builders.

The cost of doing collapsed. The cost of trusting didn't.

AGENTS WORK

Capability crossed the line

Agents with real tools now finish multi-step work end-to-end. Orchestration, not intelligence, is the bottleneck.

COST FELL

Judgment got cheap

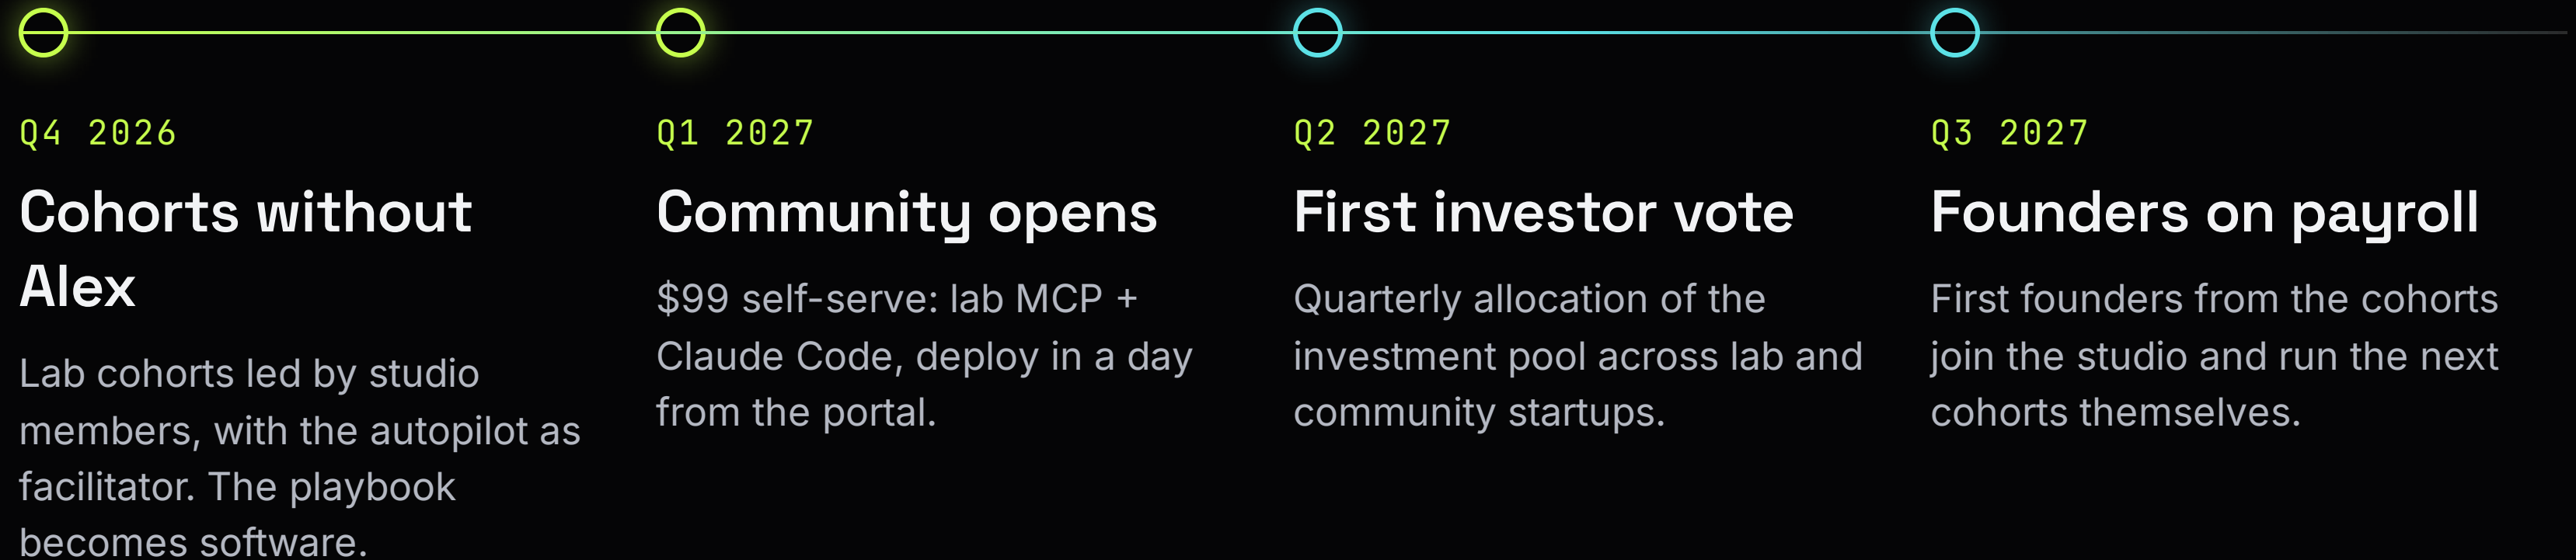

Sub-second decision models and local embeddings let the autopilot think constantly and call a large model only when it matters.

TRUST IS THE GAP

Nobody owns the harness

Every company wants autonomy; almost none can audit it. A signed, bounded, self-correcting autopilot is the missing layer.

Take the founder out of the loop.

Half human, **half agents.**

Alex Shkor

Founder & managing member. Architect of the Simbiot autopilot; chairman of Cooperative 42. US entity, payments and production infrastructure.

Yura

Board. 14 years building products and businesses; finance, tax, legal and M&A. Runs Vybirai and Monetix.

Vlad

Board. End-to-end video production with his own studio; runs ReelsUp, Avatar and xSaleBot.

The fleet

Sixteen agents in production — sales, content, research, finance, operations — each with its own server, memory and signed track record.

\$1M

Pre-seed · uncapped SAFE with MFN · rolling close

instrument	SAFE, uncapped , MFN
governance	quarterly vote on the pool
issuer	Shkor Labs LLC (Wyoming)
offering	Reg D 506(b), warm network only

Use of funds

INVESTMENT POOL

Capital for the studio's startups, allocated quarterly by investor vote.

STUDIO TEAM

Salaries for cohort leads, so new cohorts start without the founder.

PLATFORM

Autopilot, lab MCP and the self-serve \$99 community.

- SHKOR LABS

Every company will run on an autopilot.
We're building the one you can trust — by
running our own businesses on it first.
